

Company News Component

A standalone news backend for a 1,515-company investment catalogue — and how it plugs into the existing app.

In plain words. We were given a list of 1,515 real companies from all over the world and asked to keep a fresh news feed for every one of them. The catch: free news APIs only cover companies listed in America. The trick we found is that most foreign companies *also* trade in America, usually under a different symbol. So instead of paying for an expensive worldwide news service, we first work out every place each company is traded — and that alone brings **95%** of the list within reach of a free service.

What was built, step by step

- 1. Read the company list and check it properly.** The supplied file contradicts itself in places — 128 rows say a company is American when its exchange says otherwise, 46 have the wrong country, 62 have no exchange at all. We record every problem instead of quietly “fixing” it, so there is a paper trail.
- 2. Work out where each company actually trades.** This is the heart of the project. Using two free data sources, we find every exchange a company is listed on, including its American depositary receipt (a US-traded version of a foreign share). That is what makes free news coverage possible.
- 3. Catch the traps.** A ticker symbol is not a reliable name. In this list, **BBY** means Balfour Beatty — but on a US exchange **BBY** is Best Buy. We found **seven** such collisions. Left alone they would fill one company’s page with another company’s news, and nobody would notice, because the feed would look perfectly normal.
- 4. Fetch the news.** News sources sit behind a common interface, so swapping or adding one is a configuration change rather than a rewrite. Running it twice never creates duplicates.
- 5. Keep only news that is actually about the company.** Name-based searching was filing stories about *Jensen Huang* (Nvidia’s boss) under Jensen-Group, and a film review under a Norwegian retailer called Kid. Those are now rejected before they are ever stored.
- 6. Add world news.** A story about conflict or interest rates moves share prices without naming any company. Company-by-company feeds can never show that, so there is a separate market feed — and it comes from Reuters, CNBC and Bloomberg rather than aggregators.
- 7. Make failures visible.** “This company had no news today” and “the provider refused to answer us” look identical in a simple system. They are recorded separately here, because the second one means coverage is silently breaking.

Measure	Result	Meaning
Companies in catalogue	1,515	34 countries, 33 exchanges
Resolved to a real security	1,474	97.3%
Exchange listings found	2,021	including 149 depositary receipts
Companies returning news	1,093	72.1%; most of the rest were genuinely quiet
Ticker collisions caught	7	would have produced convincing but wrong feeds
Full run	26.7 min	0 failures, 0 refusals
Articles stored	6,687	309 rejected as not about the company

Where the news comes from

Feed	Primary wire	Aggregator	Comment
Market & macro	60.6%	39.4%	Reuters, CNBC, Bloomberg
Company news	2.7%	97.2%	Yahoo, Benzinga, Seeking Alpha

This is the clearest limitation of the free tier, and the strongest argument for paying later: company news is dominated by three aggregators, while the market feed proves that primary-wire quality is achievable.

Do we need to pay for anything?

Not yet — and that is a measured conclusion, not a cost-saving dodge. A paid service would mainly help **285 companies** whose only US presence is a thinly-covered over-the-counter line: three quarters of them currently get nothing. It would also improve source quality and cut the run from 27 minutes to about 5.

The recommendation is to buy when one of four things becomes true — all of them measurable today, such as unverified name matches rising above 15% of stored articles. That figure is **0.9%** now.

The interface

Global News. The full 1,515-company catalogue served by the news component over its API. Note the blue chips under each company: LN: 0A1U plus US: UBER shows a London depositary line correctly resolved to Uber's American listing. Centre-top is the market feed with primary wire badges; below it company news labelled aggregator so the source quality is never hidden.

A collision, resolved. Searching “Admiral” returns Admiral Group with its London listing and both US lines, including the ADR AMIGY . A naive lookup of the ticker ADM would have returned Archer-Daniels-Midland — even filtered to London, because ADM trades there too.

Catalogue. The original company browser with live prices.

The integration contract

The screenshot shows the fastify API documentation interface. At the top, there's a header with the 'fastify' logo and a search bar containing 'http://localhost:8080/docs/json'. Below the header, the title 'Company news component' is displayed with version tags '1.0.0' and 'OAS 3.0'. A description follows: 'Standalone news backend. Resolves every catalogue ticker to its exchange and to the full set of venues it trades on, then keeps a deduplicated news feed per company.' The interface is organized into three main sections: 'companies', 'news', and 'ops'. Each section lists its endpoints with their respective HTTP methods. The 'companies' section includes endpoints for getting companies, company news by ticker, and listings. The 'news' section includes endpoints for market news, company news by ticker, and general news. The 'ops' section includes endpoints for health, readiness, status, fetching data, runs, and the latest runs. The 'POST /v1/fetch' endpoint is highlighted in green.

companies Tracked companies and resolved listings

- GET `/v1/companies`
- GET `/v1/companies/{ticker}`
- GET `/v1/listings`

news Article feeds

- GET `/v1/market-news`
- GET `/v1/companies/{ticker}/news`
- GET `/v1/news`

ops Health, runs, and on-demand fetch

- GET `/health`
- GET `/ready`
- GET `/v1/status`
- POST `/v1/fetch`
- GET `/v1/runs`
- GET `/v1/runs/latest`

Live API documentation. Fourteen endpoints, generated from the code itself and browsable at `/docs`. Another system integrates against this — there is no shared database and no shared code.

What we deliberately did not do

- **No AI model anywhere in the pipeline.** News text is written by strangers and anyone can put a press release on a news site. Letting a model read that text and decide what gets stored would hand outsiders influence over the system. The rules used instead can be tested and explained.
- **No article scraping** — headlines, links and provider summaries only.
- **No login.** The service is designed to sit on a private network behind an existing gateway; an optional access token is available for the one endpoint that does real work.

Known weaknesses

- **41 companies (2.7%) could not be resolved** — mostly obscure over-the-counter listings. They are reported, never silently skipped.
- **Filtering has a cost.** Three companies went from *wrong* coverage to *no* coverage. For an investment product an empty feed beats a misleading one, but it is a real loss.
- **One ingest worker.** Running several in parallel needs shared rate limiting first.
- **First start takes about 38 minutes** while it resolves all 1,515 companies — or a few minutes with a free OpenFIGI key.

Company news component — 1,515 companies, free API tiers, \$0 recurring cost. Figures reproducible from the live database with `npm run metrics`.
