

Extra data sources — what we checked

We looked at **Bloomberg** for premium news, and **Polymarket**, **Kalshi** and **ForecastEx** for event probabilities. Polymarket is technically accessible but needs written data-use permission for our integration; ForecastEx is worth trying.

Bloomberg — no

Bloomberg has the best data. **The blocker is their contract, not the price.**

Their licence, which we read directly, forbids storing their data in a database, sending it to anyone else, using it in an automated system, or connecting from a machine not logged into a Terminal. Our service does all four. A seat costs **\$31,980/year**, and buying one wouldn't help — the restrictions come with it.

They sell feeds needing no Terminal, but those are for desks to trade on, not to show readers. The one product that *allows*

republishing is a separate media business selling by topic ("Technology", "Energy"), not by company — so even with money, it can't answer "news about this company."

This won't change: their licence bars anything that could cost them a Terminal subscription.

Polymarket — accessible; permission for internal use still needs confirmation

We can retrieve public data, but have not verified written permission for our intended use. On 8 September 2026, direct requests to the Polymarket hosts we tested failed with connection resets. A remote page reader nevertheless returned a public Gamma API market record and the CLOB server clock, without a VPN or account. This establishes another way to retrieve data, but not a reliable production connection. Public market-data access does not require signup; signup and trading have separate location requirements. API documentation.

How we would connect: Polymarket provides official APIs that return structured data, so we do not need to extract it from website pages.

Interface	Data available
Gamma API	Events and markets, descriptions, possible outcomes, dates, status and volumes
CLOB API	Contract prices, buy and sell orders, and price history
WebSocket	Updates over a persistent connection when near-real-time data is needed

Market discovery, prices and history, streaming updates. After permission is confirmed, a server job could select relevant markets, request updates every few minutes within the API limits, store the permitted history and display it on an employee dashboard. For example, it could track the market's assessment of a Fed rate cut alongside related news. A stable, permitted network connection still needs to be established.

We also retrieved the actual terms automatically. The terms page embeds a Google Doc, whose full text we downloaded. The checked version is effective 11 August 2026. Official terms.

Internal use does not automatically remove the permission requirement. Section 4.2 separately restricts access and use by covered organizations, and redistribution to specified recipients. Keeping the data inside the company addresses external distribution, but not the first restriction. Covered users include professional entities engaged in capital-markets activities, with fintech companies among the examples, and market-data distributors. Classification depends on the legal entity's actual activities; our investment-research project is likely covered. The restriction includes API and blockchain data, including derived, aggregated and anonymized forms. We found no explicit exception for internal analytics, evaluation or prototypes. Section 4.2 also expressly prohibits scraping, so switching from the API to a scraper does not resolve the issue. Official terms, section 4.2.

The intended scope is now employee-only analytics, with no public publication. The permission request should cover:

Intended use	Rights to confirm
Show event probabilities alongside news on an employee dashboard	Internal access, analysis and display
Save prices and build historical charts	Storage and historical-data use
Calculate a sentiment score from market prices	Derived-data use

Public display or redistribution through a customer API would need separate confirmation if the scope expands later.

ICE announced exclusive distribution of Polymarket data for **institutional capital markets**. Polymarket directs relevant companies to consult its licensing team and ICE. **An agreement grants usage rights; it is not necessarily the purchase of an API key.** Many public data requests already work without one. The approved delivery method could be the existing API or an institutional

feed; ICE offers current and historical Polymarket data. The available delivery option, price and any trial access remain unconfirmed. We should request permission for internal analytics only, with no trading or external sharing, specifying the data fields, history retention and employee users. No licensing request has been sent as part of this review. The contact is **data-licensing@polymarket.com**. ICE announcement, Polymarket licensing information.

What we can prepare before contacting them: an integration based on the documentation and synthetic test data. A successful public API response does not establish permission for recurring collection into our working system. We should confirm written permission before starting that collection; the reviewed sources do not establish a universal fee or a requirement for every approved integration to use ICE's feed.

A VPN does not resolve data rights or trading eligibility. Section 4.1 prohibits using VPNs or similar tools to circumvent restrictions. Section 1 separately allows informational viewing by users in restricted jurisdictions; that does not authorize trading or our commercial integration. Official terms.

Kalshi — no

A properly regulated US exchange, so it looked promising. But its developer agreement, which we read directly, limits the API to *"facilitating a member's own trading"* and forbids *"collecting, caching, aggregating, or storing data."*

Plainly: **their API is for you to trade with, not to build a product on.** Showing their prices to users is exactly what it prohibits. Also network-blocked.

ForecastEx — worth trying

This one works. ForecastEx is a US exchange regulated by the CFTC, and that regulation **requires it to publish its daily prices.** It does, as plain CSV files on its website.

We downloaded them: no key, no account, current data. Each file gives, per market per day, open, high, low, close, settlement price and open interest — a full history of how the odds moved. It covers inflation (CPI), Fed rate decisions, payroll employment, jobless claims, GDP, retail sales, housing starts and elections.

Why this is legally different: with the others you'd be taking data from a private system against its rules. Here it's published because a regulator requires it. We looked for a terms-of-use page and found none — though no terms isn't the same as written permission.

Check first: most actual trading there is in *weather* markets. The economic markets are real, but we haven't measured whether enough money trades in them for the numbers to mean much.

Suggestion

Keep the news stack as it is — nothing here changes it. **Try ForecastEx.** It downloads today with no negotiation, and suits a small feature showing what the market expects for the next inflation report or Fed decision: something news can't tell you, because news reports what already happened.

Send one email asking if we may display their prices with credit — cheap, and it turns "found no rules against it" into a written answer. Don't build on Kalshi without a signed agreement. For Polymarket, we can prepare an integration using synthetic data, but should confirm written permission before collecting real data for the internal system.
