

Company news component — project report

A standalone backend that keeps a news feed for every company in a **1,515-company catalogue**. Its own process, its own database, no UI.

Every figure is reproducible with `npm run metrics` ; the gaps with `npm run export:gaps` . Article counts are a snapshot of a live corpus.

Results

Companies in catalogue	1,515	Connected	1,501 (99.1%)
Identified to a real security	1,510 (99.7%)	Returning news	1,449 (95.6%)
Exchange listings found	2,021	Attribution certain	99.9% of links
Depository receipts	152	Articles with an image	83.6%

Recurring cost: \$0. No paid API, and no language model is called anywhere.

"Connected" is the metric that matters. A company counts as working when it either has news *or* was asked correctly and genuinely had none. A quiet week is a real answer — treating it as a failure is how a broken pipeline hides. `GET /v1/status` reports this live and names the companies in each faulty state.

How it works

The problem: free news APIs cover companies listed in America. A third of this catalogue isn't American.

The approach: most foreign companies also trade in America under a different code — Toyota is `7203` in Tokyo and `TM` in New York. So before fetching any news, every ticker is resolved to *all* the venues it trades on, including its US depository receipt.

Segment	Companies	
US exchange listing	1,311	Well covered
US OTC line only	170	Thinner coverage
Reachable with a US symbol	1,481 (97.8%)	The two above
No US line at all	29	Needs a non-US source
Not identified	5	See below

That resolution step is why no paid API is required.

Five problems that mattered more than coverage

- 1. The window was too narrow.** Asking for 7 days made active companies look silent — AvalonBay returned **0 articles over 7 days and 89 over 90**. The first fetch now looks back 90 days; later runs fetch only since the last one.
- 2. A confident zero stopped the chain.** 263 companies were reported as having no news after only one provider was tried. That rule was right when the fallback guessed by company name, but the fallback is now ticker-native, so a second opinion costs nothing. It now falls through, stopping only if the remaining sources are name-matched.
- 3. Links pointed at a redirect, not the article.** Finnhub returns a link into its own domain that 302s onward. Storing that meant every reader paid an extra hop, the link died if Finnhub did, and the hidden destination made a dead publisher impossible to filter. Links are now resolved to the publisher's own address before storing: **0 wrappers across 214 domains**. That exposed `chartmill.com`, which refuses every connection, now filtered out.
- 4. Four major UK companies were silently mis-queried.** Identifier sources write LSE tickers in Bloomberg form — Aviva is `AV/` , BAE `BA/` , Rolls-Royce `RR/` . Appending the venue suffix produced `AV/.L` , which matches nothing, so all four returned a clean zero indistinguishable from a quiet week.
- 5. Scarce quota went to companies that did not need it.** Companies were fetched in catalogue order, so the fallback provider's 100 daily lookups were spent on whoever sorted first — 36 well-covered companies sat ahead of the first company with no news at all. Companies without news are now served first.

What happens when a reader clicks

Links open the publisher directly. Where they land:

Publisher	Share	What the reader sees
finance.yahoo.com	46.5%	Opens normally
benzinga.com	23.2%	Often a bot check or sign-up prompt
seekingalpha.com	12.5%	Often a registration wall
fool.com and 210 others	~18%	Mostly opens normally

About 36% of clicks may meet a registration wall. Nothing is broken — these are the correct publisher URLs. Those sites serve real browsers fine, and dropping them would delete a third of the feed.

This is not fixable with the current providers. Finnhub and Marketaux license a headline, a teaser and a *link*; rendering the full text anyway would be republishing copyrighted work. Showing articles in our own interface is a licensing decision — see below.

The 14 companies with no news, and why

The other **1,501 of 1,515 (99.1%)** are connected — each either has news, or was asked correctly and genuinely had none in the 90-day window. A clean zero is a real answer and is not listed here.

Not identified — 5

Two distinct causes, both the limit of what free identifier data can do.

The name is written differently in the two sources. Our catalogue says `Construcciones y Auxiliar de Ferrocarriles`; the identifier directory says `CONSTRUCC Y AUX DE FERROCARR`. A word-by-word comparison sees "construcciones" and "construcc" as different words — like "Christopher" and "Chris". It scores **0.53** where 0.60 is required. Lowering the bar would also let "Apple" match "Apple Hospitality Trust", a different company, so the threshold protects more than it costs.

The right company, but only useless listings. Unipol's name matches easily (**0.92**). What comes back is `UNIGBX`, `UNICHF`, `UNIUSD`, `UNIGBP` — the same company priced in different currencies on venues no news provider covers. Its actual Milan listing never appears in the results.

Ticker	Company	Why
<code>ØQ6M</code>	Unipol Gruppo Finanziario SpA	Only currency-variant quotes returned — never its Milan listing
<code>ØRKF</code>	Construcciones y Auxiliar de F	Directory abbreviates the name ("CONSTRUCC Y AUX") — too different to match safely
<code>BMRM.F</code>	Société Anonyme des Bains de M	Directory abbreviates the name — too different to match safely
<code>CIEZ.F</code>	Corporación Interamericana de	Only currency-variant quotes returned — never its home listing
<code>NVPT.F</code>	Navitas Petroleum, Limited Par	Only currency-variant quotes returned — never its home listing

Each could be connected by hand-writing "this name means that name", one company at a time. At five companies (**0.3%**) that is a maintenance burden with a small chance of introducing a wrong match, so they are reported as unresolved rather than guessed.

No provider covers them — 9

Identified, but the only code we can resolve is an exchange's internal listing code rather than the company's own ticker. London lists foreign companies under synthetic `ØXXX` codes — Heijmans is `ØM6I` — and no news provider recognises them. **These are reported honestly rather than queried with a dead symbol**, which would return a clean zero indistinguishable from a quiet week.

Ticker	Company	Why
ØE64	DO & CO AG	Only a London international-board code, which is not the company's ticker
ØGQE	Clas Ohlson AB	Only a London international-board code, which is not the company's ticker
ØHØG	Sweco AB	Only a London international-board code, which is not the company's ticker
ØM6I	Heijmans NV	Only a London international-board code, which is not the company's ticker
ØNUG	Magyar Telekom Tavkozlesi Nyrt	Only a London international-board code, which is not the company's ticker
ØQEP	Maire Tecnimont SpA	Only a London international-board code, which is not the company's ticker
ØREQ	Per Aarsleff Holding A/S	Only a London international-board code, which is not the company's ticker
603558	Zhejiang Jasan Holding Group C	Shanghai A-share; no free provider covers it
MIA	Malta International Airport PL	Malta exchange; no provider covers it

The component in use

No UI of its own — it is a backend. These are the existing research app consuming it over its HTTP API.

"also mentions 1 other" is the shared-article model: a story naming several companies is stored once and linked to each.

Do we need to pay?

Not for coverage — 97.8% is reachable free and ticker-native.

Yes, for the reading experience. Every headline leaves the platform, and about a third land somewhere that may demand a sign-up. No free tier fixes this, because none license the article body.

Recommendation: Benzinga's embeddable newsfeed. It owns its newsroom, so its paid tiers permit the **full body and image to be shown inside our own interface** — no redirect, no third-party sign-in. Delivery is REST plus WebSocket and webhooks, so freshness stops depending on how often we poll and cost stops scaling with catalogue size. Its free tier is headline + teaser + link, i.e. the constraint we want to escape. Limitation, stated plainly: ~130–160 articles a day from a US-focused newsroom — deep, not wide. Keep **Marketaux** as the single fallback: two providers total.

Design decisions worth knowing

- **Provider-agnostic.** Sources sit behind one interface, ordered by config.
- **Idempotent.** Articles keyed on a cleaned-up URL; a daily re-run stores nothing new. Verified: zero duplicate URLs.
- **"No news" is not "provider refused."** Identical if you only count articles. Recorded separately, with every provider tried per company.
- **One ingest at a time, across processes** — a Postgres advisory lock, because the API cannot see an ingest started from the command line.
- **No language model.** Article text is written by strangers; letting a model decide what gets stored would hand outsiders influence over the pipeline.

Known limits

- **5 companies (0.3%) unidentified** — explained above.

- **Name matching is the weakest component.** "Adobe Systems" vs "Adobe" is indistinguishable in form from "Prudential" vs "Prudential Financial" — the first is one company, the second is two. Known equivalences are a small, tested alias table rather than a looser threshold.
- **Some publishers block automated clients**, so those articles carry no image. We do not disguise the service as a browser to get around it.
- **A few US companies are missing from both identifier sources.** AvalonBay and Equity Residential are absent from Finnhub's 30,995-row directory, and OpenFIGI returns their *bonds* for the same ticker. Where the supplier asserts a US listing and names a US venue, its ticker is used at the lowest confidence in the set, so consumers can filter those out.
