

Company news component — project report

A standalone backend that keeps a news feed for every company in a **1,515-company catalogue**. Its own process, its own database, no UI.

Every figure is reproducible with `npm run metrics` ; the gaps with `npm run export:gaps` . Article counts are a snapshot of a live corpus.

Results

Companies in catalogue	1,515	Connected	1,502 (99.1%)
Identified to a real security	1,512 (99.8%)	Returning news	1,450 (95.7%)
Exchange listings found	2,023	Attribution certain	99.9% of links
Depository receipts	153	Articles with an image	83.6%

Recurring cost: \$0. No paid API, and no language model is called anywhere.

"Connected" is the metric that matters. A company counts as working when it either has news *or* was asked correctly and genuinely had none. A quiet week is a real answer — treating it as a failure is how a broken pipeline hides. `GET /v1/status` reports this live and names the companies in each faulty state.

How it works

The problem: free news APIs cover companies listed in America. A third of this catalogue isn't American.

The approach: most foreign companies also trade in America under a different code — Toyota is `7203` in Tokyo and `TM` in New York. So before fetching any news, every ticker is resolved to *all* the venues it trades on, including its US depository receipt.

Segment	Companies	
US exchange listing	1,312	Well covered
US OTC line only	170	Thinner coverage
Reachable with a US symbol	1,482 (97.8%)	The two above
No US line at all	30	Needs a non-US source
Not identified	3	See below

That resolution step is why no paid API is required.

Five problems that mattered more than coverage

- 1. The window was too narrow.** Asking for 7 days made active companies look silent — AvalonBay returned **0 articles over 7 days and 89 over 90**. The first fetch now looks back 90 days; later runs fetch only since the last one.
- 2. A confident zero stopped the chain.** 263 companies were reported as having no news after only one provider was tried. That rule was right when the fallback guessed by company name, but the fallback is now ticker-native, so a second opinion costs nothing. It now falls through, stopping only if the remaining sources are name-matched.
- 3. Links pointed at a redirect, not the article.** Finnhub returns a link into its own domain that 302s onward. Storing that meant every reader paid an extra hop, the link died if Finnhub did, and the hidden destination made a dead publisher impossible to filter. Links are now resolved to the publisher's own address before storing: **0 wrappers across 214 domains**. That exposed `chartmill.com`, which refuses every connection, now filtered out.
- 4. Four major UK companies were silently mis-queried.** Identifier sources write LSE tickers in Bloomberg form — Aviva is `AV/` , BAE `BA/` , Rolls-Royce `RR/` . Appending the venue suffix produced `AV/.L` , which matches nothing, so all four returned a clean zero indistinguishable from a quiet week.
- 5. Scarce quota went to companies that did not need it.** Companies were fetched in catalogue order, so the fallback provider's 100 daily lookups were spent on whoever sorted first — 36 well-covered companies sat ahead of the first company with no news at all. Companies without news are now served first.

What happens when a reader clicks

Links open the publisher directly. Where they land:

Publisher	Share	What the reader sees
finance.yahoo.com	46.5%	Opens normally
benzinga.com	23.2%	Often a bot check or sign-up prompt
seekingalpha.com	12.5%	Often a registration wall
fool.com and 210 others	~18%	Mostly opens normally

About 36% of clicks may meet a registration wall. Nothing is broken — these are the correct publisher URLs. Those sites serve real browsers fine, and dropping them would delete a third of the feed.

This is not fixable with the current providers. Finnhub and Marketaux license a headline, a teaser and a *link*; rendering the full text anyway would be republishing copyrighted work. Showing articles in our own interface is a licensing decision — see below.

The 13 companies with no news, and why

Everything else — **1,502 of 1,515** — is working: each company either has news, or was asked properly and simply had nothing in the last 90 days. A quiet week is a real answer, so those are not listed here.

3 companies: we cannot pin down which security it is

We know exactly who these businesses are. What we cannot get is an *address*

a news provider will accept.

Shares are often quoted in several currencies on small side exchanges — a "priced in pounds" version, a "priced in francs" version — which exist for hedging and which almost nobody writes news about. For these three, those side quotes are the only thing that comes back. **The ordinary home listing, the one news is actually written against, never appears.** Four addresses for the same building, all of them back doors.

Ticker	Company	What it does	Where	Why no news
BMRM.F	Société Anonyme des Bains	Casinos, hotels and resorts in Monte-Carlo	Monaco	Only currency-hedged side quotes come back — never its Paris listing
CIEZ.F	Corporación Interamericana	Live entertainment — concerts, venues, events	Mexico	Only currency-hedged side quotes come back — never its Mexico listing
NVPT.F	Navitas Petroleum, Limited	Oil and gas exploration	Israel	Only currency-hedged side quotes come back — never its Tel Aviv listing

3 companies: no news source covers where they trade

Identified, but unreachable — each for a different reason.

Ticker	Company	What it does	Where	Why no news
0M6I	Heijmans NV	Construction — roads, housing, infrastructure	Netherlands	Its shares are Dutch depositary receipts; the search index does not return its Amsterdam line
0QEP	Maire Tecnimont SpA	Engineering — builds chemical and energy plants	Italy	Only a US-dollar side quote turns up, on a venue no provider covers
MIA	Malta International Airpor	Operates the country's airport	Malta	Malta's exchange is tiny; no provider we use carries it

Heijmans is the near miss. Its shares are Dutch **depositary receipts** (*certificaten van aandelen*) rather than ordinary stock. Searching for those now works — that fix connected Unipol — but the search index still does not return Heijmans' Amsterdam line, only side quotes. The lookup-by-ticker endpoint *does* have it; using that would mean guessing the ticker, and a wrong guess attributes another company's news.

7 companies: a usable ticker was found, news not yet requested

Six were stuck behind a London code no provider recognises. Matching the company **name** to a listing we can query fixed that — Sweco's **0H0G** became **7W7** on Xetra, CAF became **CAF** in Madrid. The seventh, Zhejiang Jasan, already had a usable Shanghai symbol.

A caveat worth stating. Only CAF landed on its home exchange. The others resolved to German or Swiss **secondary quotes** — the same kind of side listing criticised two sections above. They are queryable, which the London codes were not, but they may well come back empty, and that would move them into the group above rather than into coverage.

The news request itself has not run. The fallback provider's free plan allows 100 lookups a day, and that budget was spent when these were fixed. The next scheduled run answers it. **They are counted as *not connected* above** — until a provider has actually answered, saying they work would be a guess.

Ticker	Company	What it does	Where	Why no news
0E64	DO & CO AG	Airline and event catering	Austria	Ticker found (D0Q); not yet asked
0GQE	Clas Ohlson AB	Hardware and home-goods retail	Sweden	Ticker found (0HCB); not yet asked
0H0G	Sweco AB	Engineering and architecture consultancy	Sweden	Ticker found (7W7); not yet asked
0NUG	Magyar Telekom Tavkozlesi	Telecoms operator	Hungary	Ticker found (MGYB); not yet asked
0REQ	Per Aarsleff Holding A/S	Civil engineering and construction	Denmark	Ticker found (PE9); not yet asked
0RKF	Construcciones y Auxiliar	Builds trains and rail rolling stock	Spain	Ticker found (CAF); not yet asked
603558	Zhejiang Jasan Holding Gro	Textile manufacturing — socks and knitwear	China	Trades only in Shanghai; no free provider carries Chinese A-share news in English

The component in use

No UI of its own — it is a backend. These are the existing research app consuming it over its HTTP API.

"also mentions 1 other" is the shared-article model: a story naming several companies is stored once and linked to each.

Do we need to pay?

Not for coverage — 97.8% is reachable free and ticker-native.

Yes, for the reading experience. Every headline leaves the platform, and about a third land somewhere that may demand a sign-up. No free tier fixes this, because none license the article body.

Recommendation: Benzinga's embeddable newsfeed. It owns its newsroom, so its paid tiers permit the **full body and image to be shown inside our own interface** — no redirect, no third-party sign-in. Delivery is REST plus WebSocket and webhooks, so freshness stops depending on how often we poll and cost stops scaling with catalogue size. Its free tier is headline + teaser + link, i.e. the constraint we want to escape. Limitation, stated plainly: ~130–160 articles a day from a US-focused newsroom — deep, not wide. Keep **Marketaux** as the single fallback: two providers total.

Design decisions worth knowing

- **Provider-agnostic.** Sources sit behind one interface, ordered by config.
- **Idempotent.** Articles keyed on a cleaned-up URL; a daily re-run stores nothing new. Verified: zero duplicate URLs.
- **"No news" is not "provider refused."** Identical if you only count articles. Recorded separately, with every provider tried per company.
- **One ingest at a time, across processes** — a Postgres advisory lock, because the API cannot see an ingest started from the command line.
- **No language model.** Article text is written by strangers; letting a model decide what gets stored would hand outsiders influence over the pipeline.

Known limits

- **3 companies (0.2%) unidentified** — explained above.

- **Name matching is the weakest component.** "Adobe Systems" vs "Adobe" is indistinguishable in form from "Prudential" vs "Prudential Financial" — the first is one company, the second is two. Known equivalences are a small, tested alias table rather than a looser threshold.
- **Some publishers block automated clients**, so those articles carry no image. We do not disguise the service as a browser to get around it.
- **A few US companies are missing from both identifier sources.** AvalonBay and Equity Residential are absent from Finnhub's 30,995-row directory, and OpenFIGI returns their *bonds* for the same ticker. Where the supplier asserts a US listing and names a US venue, its ticker is used at the lowest confidence in the set, so consumers can filter those out.
