

Polymarket US — data inventory and actual examples

Updated 9 September 2026; saved API observations are from 8 September. API and capture timestamps are UTC. Website screenshots preserve the site's displayed labels. We retrieved structured public data directly from Polymarket US without a login, cookies, API key or VPN. The examples establish that an internal market-context panel is technically possible. They do not establish company usage rights, complete market coverage or production reliability. This report and its evidence remain local; they have not been published to GitHub. A local interactive MVP is implemented and tested; its 9 September browser captures and validation are recorded separately below.

The companion **Polymarket-Data-Inventory.xlsx** contains the detailed inventory and example values. Original responses and the request manifest are in `polymarket-evidence/2026-09-08/`. Each manifest entry records its URL, HTTP status, request/receipt times and SHA-256 hash. Main API samples were received at 19:02:54–19:02:56; the resolved-market settlement sample at 19:03:47. These are observations at those times, not current trading recommendations.¹

Workbook `AllObservedFields` catalogues every terminal field observed in all 13 saved responses, with array positions grouped as `[]`, observed types, occurrence counts and up to three actual example values. `FieldExamples` adds explanations for selected fields. This is a complete catalogue of those observed responses; documented optional fields and the wider exchange catalogue can exceed the sample. The newer chart has separate `MVPHistory` provenance.

1. What is available without an account

The public base is `https://gateway.polymarket.us`. We checked 13 requests: 12 returned HTTP 200; the open market's settlement request returned HTTP 404. The official documentation describes this API as sufficient for applications displaying market information.²

Data	Actual response inspected	Application use
Search and event	One Fed event, containing five contracts	Find relevant topics and group related outcomes
Market definition	IDs, question, rules, dates, status, side identities and quotes	Explain exactly what a displayed number refers to
Event and market images	Image URLs, including a Fed-event portrait and a sports-team logo	Event artwork; separate from article images or an image-reuse licence
Best bid/offer (BBO)	Bid, ask, last price, depth counts and statistics	Compact quote card and spread
Order book	13 bid levels and six offer levels	Depth and liquidity context
Price history	249 daily-window and 57 weekly-window samples	Historical display-price charts
Settlement	Open-market 404; resolved-market value 1	Distinguish unresolved contracts from final results
Reference data	Two series, two leagues and five tags	Navigation and classification

The reference counts are the requested sample sizes, not catalogue totals. No ongoing collector was started for that evidence capture. The local MVP's interactive refresh behaviour is described in section 9.

Public API

`https://gateway.polymarket.us`

Use the public API to browse what's available on Polymarket US. No API key needed. This is where you fetch markets, events, series, sports data, and search results. If you're building something that displays market information - prices, odds, order books - this is all you need.

Actual browser screenshot of the official documentation, captured at 2026-09-08 19:11:16.306 UTC. This is documentation evidence, not an API response.

2. A real macro example: September Fed decision

Search GET /v1/search?query=Fed&limit=1 returned event 65124, slug usfed-fomc-2026-09-16 . The event-detail response contained five contracts, all active and open. The event category was macro ; its tags included Econ , macro and Fed . The following quotes come from one saved event response, received at 19:02:54.365 UTC.

Contract title	Market ID	Best bid, USD	Best ask, USD
50+ bps Increase	313136	0.0100	0.0200
25 bps Increase	313137	0.5100	0.5200
No Change	313138	0.4700	0.4800
25 bps Decrease	313139	Not supplied	0.0100
50+ bps Decrease	313140	Not supplied	0.0100

Values are at event.markets[].bestBidQuote.value and event.markets[].bestAskQuote.value . A missing bid is not zero. These prices must not be normalized into an invented probability distribution. Establish outcome definitions and settlement rules before combining contracts.

Actual Polymarket US website screenshot, captured at 2026-09-08 19:04:10.892 UTC. It is a separate observation from the earlier API samples: website prices may differ. Source: ³.

3. Market definitions and field mapping

We inspected GET /v1/market/slug/rdc-usfed-fomc-2026-09-16-nochng . The singular /market/slug/ path differs from the plural quote/book routes. Its market object identified No Change, ID 313138. The description defines settlement using the upper bound of the federal funds target rate at the September FOMC meeting and names the Federal Reserve as the source. Preserve the complete rules in an approved implementation; this report paraphrases them.

Field path	Observed value or meaning
market.slug	rdc-usfed-fomc-2026-09-16-nochng
market.status	MARKET_STATUS_OPEN ; closed was false
market.marketSides[].id	Yes: 625838; No: 625839
market.marketSides[].long	Yes: true; No: false
market.marketSides[].quote.value	Yes: 0.4800; No: 0.53
market.orderPriceMinTickSize	0.01
market.minimumTradeQty	0.01

Two actual inconsistencies matter. Event `endDate` was September 16 at 23:59, whereas the contract's `endDate` was September 30 at 23:00. Store both, with their field meaning; do not infer the meeting date from either alone. Also, legacy `outcomes / outcomePrices` arrays were incomplete or misleading across the five contracts. The 50+ bps decrease contract had two outcome labels but only one price. Validate explicit side identities and quote fields rather than zipping legacy arrays. ⁴.

4. Quotes, depth and trading statistics

For the same No Change contract, the BBO response contained:

JSON path under <code>marketData</code>	Value
<code>bestBid.value / bestAsk.value</code>	0.4700 / 0.4800 USD
<code>lastTradePx.value / currentPx.value</code>	0.4800 / 0.4700 USD
<code>longQuote.value / shortQuote.value</code>	0.4800 / 0.53 USD
<code>bidDepth / askDepth</code>	13 / 6
<code>sharesTraded / openInterest</code>	37233.5500 / 456927.4600

The book confirmed `marketData.bids[0]` at **0.4700**, quantity **566.1400**, and `marketData.offers[0]` at **0.4800**, quantity **5129.0200**. The spread is 0.0100 USD. These are available quoted quantities at the sampled instant, not guaranteed fills or proof of enduring liquidity.

Book `stats` also supplied open/high/low/close, last-trade quantity, notional and individual update timestamps. For example, `lastTradeQty` was **0.3800** and `lastTradeSetTime` was **19:00:56.848 UTC**, about two minutes before collection. `notionalTraded.value` was **1828974.7500**, with currency `USD`; preserve the reported field and verify its units and measurement period before calculating turnover. Field availability alone does not validate our interpretation.

Do not collapse all price fields into “probability.” Current price, last trade, executable quotes and sampled display prices differ even within these responses. ^{5,6}

5. History: useful data, with visible gaps

Both requests used `/v1/price-history`, with the contract slug as `symbol`. Each `history[]` item contains Unix-seconds `timestamp`, `longPrice` and `shortPrice`. These are book-derived display prices, not executed trades.

Requested parameters	Actual returned coverage
<code>fixedInterval=INTERVAL_1D&fidelity=5</code>	249 points; September 7 19:00 to September 8 19:00
<code>fixedInterval=INTERVAL_1W&fidelity=180</code>	57 points; September 1 18:00 to September 8 18:00

The weekly samples were three hours apart. Daily samples were usually five minutes apart, with gaps from September 8 **06:25–06:50** and **06:50–09:55**. The response does not establish why points were absent. Do not invent data between observations or promise a complete historical archive.

The latest daily point was **0.48 long / 0.53 short**. Their sum exceeds one: these display prices reflect the two sides and spread, rather than a pair of complementary verified probabilities. The live `lastPriceSample.shortPx` field was 0.52 instead; retain field identity and timestamp when comparing sources. ⁷

Chart generated from the actual saved history samples. It is our visualization, not a screenshot of Polymarket's interface; missing samples remain missing.

6. Settlement and reference data

The open Fed contract's dedicated settlement endpoint returned **404**, with “Settlement not found.” Nevertheless, its BBO/book contained `settlementPx.value=0.5000`. That field is therefore not proof of final event resolution. A separate resolved sports contract, `aec-nfl-lac-ten-2025-11-02`, returned **200** and `settlement: 1`; its market status was `MARKET_STATUS_RESOLVED`. Resolve state and side identity together.⁸

Reference calls returned series **NFL** and **NFL 2025**, leagues **UEFA** and **MLB**, and five tags including **Supreme Court**. They expose IDs, labels, slugs and sometimes parent/league relationships. A tag's existence does not prove an active market or usable liquidity. Teams and schedules are documented capabilities but were not separately requested in this inventory.

7. Images and news: different content sources

The public market schema includes `image`, subject images and team logos/icons. Actual responses contained event artwork: the Fed event's `image` was a portrait URL, while the sports-market sample referenced a team logo. Contract `description` fields explain the question and settlement rules; they are not article bodies. Image URLs establish technical availability, not unrestricted rights to copy, redistribute or use third-party photographs and logos. Market reference.

Polymarket does publish journalism. Its separate publication, **The Oracle**, contains news analysis and interviews. The current US API documentation index has no documented news/article endpoint. International Journalism Tools also offer a market timeline with related stories, but that website feature does not establish a supported news-ingestion API or a republication licence for us. ^{9, 10 11}

The MVP therefore uses **Polymarket US for market data and event artwork** and our existing news sources for a separately labelled **Related news** section. Keep the original publisher, date and article link. A topic match is contextual; it does not establish that the article caused a price change. A link to The Oracle is distinct from importing or reproducing its articles. News-provider content and image rights remain governed by their own terms.

8. Connection options beyond the saved samples

Route	Documented capability	Verification status
Retail market WebSocket	Real-time books, price updates and trades; API key required	Optional credentialed connection implemented for the MVP; upstream authentication and delivery not tested
Direct Exchange data API	Read-only reference data, BBO, depth and statistics through REST/gRPC	Documentation reviewed; no credentials obtained
Private/account API	Own balances, positions, orders and private updates	Not accessed; unnecessary for the proposed panel

Public REST is documented at **20 requests/second/IP**. It requires polling and does not capture every intervening change. Retail keys require account and identity verification; institutional data access has separate onboarding. No measured streaming latency or service guarantee follows from these tests. The local preview refreshes selected market data through REST every **10 seconds**; this

is polling, not an authenticated WebSocket session or a lossless trade feed. ^{12, 13, 14}

9. Local MVP implementation and capture record

The local preview at `/polymarket` combines search and topic selection, event graphics, YES/NO price tabs, a time-based history chart with shaded gaps, order-book context, statistics, contract rules and related article cards. Its path is **Next.js page** → **server-side adapter** → **public Polymarket US REST**. It is separate from the future persistent Postgres collector and employee production deployment. Optional WebSocket support uses a server-side connection and forwards status, quote and book updates to the page through SSE. It requires server-side credentials; none are configured locally and no authenticated upstream stream has been verified.

The preview deliberately limits scope: search returns up to **eight events**, with up to **40 contracts per event**; the page shows the top **five bid and ask levels** from an adapter capped at 50 per side. It displays **six news cards** from at most 12 results and offers **one-day and one-week** history views. These bounds describe the local interface, not an exhaustive exchange archive.

Preview refresh	Implemented behaviour
Selected quotes and book	REST refresh every 10 seconds; pause control and hidden-tab pause
History	Reuse identical requests for 30 seconds; retain time spacing and gaps
Event detail	Refresh every 60 seconds
Related news	Refresh every five minutes through the separate news endpoint

The product AI panel is hidden on this page and Polymarket prices are not sent to its AI pipeline. Related news comes through the existing provider path.

Charts use returned historical display-price samples. They must retain gaps and identify empty history rather than generate illustrative prices. Poll timestamps, upstream price timestamps and last-trade timestamps describe different things. Related news retains its own provider attribution; it is not presented as a Polymarket news API response.

Validation completed at 2026-09-09 02:27:04.221871 UTC. Eleven recorded browser checks covered public quotes/book/history, a loaded event image, automatic refresh, pause/resume, day/week switching, keyboard chart inspection, search and contract identity, simulated upstream failure with labelled old data, 390-pixel mobile layout, desktop/dark rendering and no browser runtime errors. Ten real quote responses had receipt times from **02:26:20.925 to 02:27:00.930 UTC**. The code also passed **19 unit tests, targeted ESLint, TypeScript checking and a production build**. Authenticated upstream WebSocket remains untested.¹⁵

The separately saved local response for **Fed No Change** recorded bid **0.47**, ask **0.48**, YES **0.48**, NO **0.53**, and last trade **0.48**; the quote receipt was **02:26:45.750 UTC**. Its chart data contained **243 points and four gaps**, received at **02:26:21.673 UTC**. Workbook `MVPHistory` records these normalized points and their file hash. They are distinct from the older 249-point sample in section 5; each screenshot has its own capture time.¹⁶

The related-news request returned **nine results with eight image URLs**; the page displayed **six cards**. The newest returned article was dated **30 August 2026**. A successful provider request therefore does not establish real-time news: the UI preserves article dates and source attribution. An additional browser check confirmed that selecting a Bitcoin event changes related news to the Crypto category; the news request uses that category without sending Polymarket contract text to the news provider.

Related reporting from our news providers; not supplied by Polymarket. Topic matching does not establish a cause of market moves.

Actual local MVP related-news section, captured on 9 September 2026 at **02:26:51.853924 UTC**. Article cards are attributed to configured providers; they were not obtained through a Polymarket article API. Capture hashes and the mobile/dark screenshots are in the validation record.¹⁷

10. Permission, cost and the practical next step

No key was needed for these public reads; company usage permission is still unresolved. We made the requests without contacting Polymarket or requesting individual technical approval. US documentation welcomes data displays, while linked app terms limit the standard data licence to personal, noncommercial trading-related use. Our interpretation is that neither public accessibility nor a personal login establishes rights for recurring corporate analytics. Confirm our specific use in writing, or obtain the appropriate agreement, before production collection.¹⁸

Question	Conclusion for our project
Can it connect without contacting Polymarket?	Public REST can; no key or separate technical approval step is required
Must we pay?	Not established; no public price for our intended corporate use was found
Does a working local page establish permission?	No; it demonstrates technical behaviour, not a corporate data licence or a provider-approved trial
What is needed before recurring production use?	Written confirmation of our public-API usage scope or an applicable agreement

Calling a page local, internal or a pilot does not create a licensing exemption. The saved samples and interactive development checks should be described by their actual scope, not as an approved free commercial dataset.

The documented Market Data Agreement route is **data@polymarket.us**. We have not established its price, that payment is inevitable, or that every public API request requires institutional onboarding. The market response's `feeCoefficient` is not a data-licence quote. Confirm employee display, storage, retention, backups, event images, derived metrics and external AI processing explicitly. No licensing request, purchase or trading action was made.¹⁹

Polymarket's July 2026 Institutional Research announcement separately offers commercial data sales for both its US and international exchanges through `institutional@polymarket.com`. It does not publish our price or say that every public read requires payment. The US fee schedule describes trading charges; those charges are not a quote for a read-only data licence.^{20,21}

This inventory concerns Polymarket US. International `polymarket.com` uses separate APIs and licensing; ICE's international role does not establish a US requirement.
